

WebPwn Toolkit Audit & Fix Summary

Project: webpwn-toolkit

Workspace fix report for UI module ordering, scan progress feedback, admin false-positive filtering, and PDF packaging.

1. Codebase Summary

Files updated:

- web_server.py
- webui/app.js
- webui/style.css
- modules/web/admin_hunter.py

2. Backend fixes

- /api/modules now returns ordered web attack modules as an array with display numbers and task keys, ensuring UI ordering is stable and labels match the backend.
- Session configuration and scan orchestration remain centralized in web_server.py with proper target normalization and active scan cancellation support.

3. Frontend fixes

- buildModuleList() now supports both object and array module definitions.
- Module cards use actual backend task keys for selection, preventing mismatches between displayed numbering and executed tasks.
- Scan progress emits current/total/module data to the UI and updates a progress bar with live feedback.

4. Admin panel false-positive filtering

- modules/web/admin_hunter.py skips passive leak checks when a login form is present, avoiding false positives on auth-protected pages like Juice Shop admin routes.
- Open dashboards without login are still flagged as a valid Broken Access Control finding.

5. Outcome

A consolidated PDF summary has been generated at webpwn_toolkit_audit_summary.pdf in the workspace root.

Architecture & Scan Flow
